

What is Linkapp?

Linkapp is your personal, customizable link organizer. Think of it as your private web portal where you can store and arrange all of your important links so they are always at your fingertips. The main difference from your browser's bookmarks is that here, you decide how to structure and name your links so you'll never forget them. You no longer have to keep dozens of tabs open in ten different browsers, only to forget what you wanted to look at when you finally have time. You can easily transfer all your links between browsers and devices.

How to Use the App

1. Key Elements

Pages. These are the main sections for grouping your links.

You can use them for different topics, like "Work," "Hobbies," or "Shopping.»

- To switch between pages, use the numbered buttons at the bottom of the screen.
- Use the "+ Add page" and "- Delete current page" buttons to add and delete pages.

Sections. Within each page, you can divide your links into smaller groups, or "sections." For example, on the "Work" page, you could create sections like "Design" and "Documents.»

- Click "+ Add section" to create a new section.
- To rename a section, click the ↻ icon next to its name.

Buttons. These are your actual links. Each button is a single link with a name that makes sense to you.

- Click + to add a new button to a section.
- To change a button's name and its link, click the ↻ icon on the button itself.

2. Saving and Transferring Data (This is Important!)

The app works like a regular document on your computer. All changes (adding or deleting buttons) are automatically saved in your browser. You don't need to constantly click "Save." However, if you want to transfer all your links to another device, use the "Save" and "Open" buttons.

- The "Save" button creates a backup of all your links as a file. Save this file to your computer so you don't lose it.
- The "Open" button allows you to import this backup file into the app on another device.

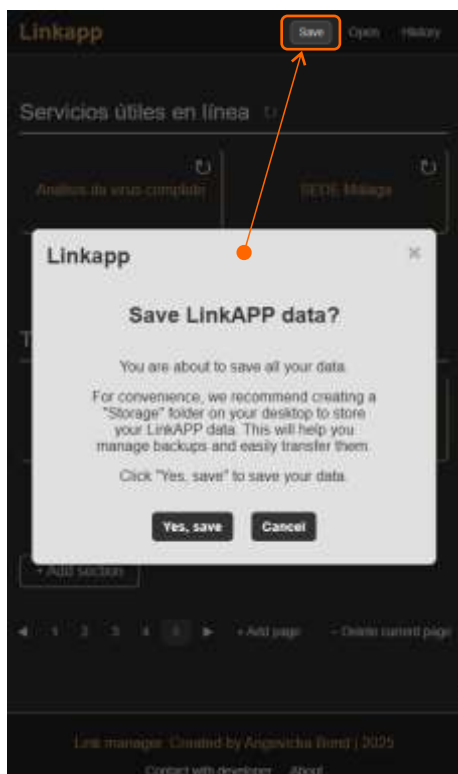

Remember: You don't open the file directly. You must always first open the app in your browser, then import the file using the "Open" button.

3. Other Useful Features

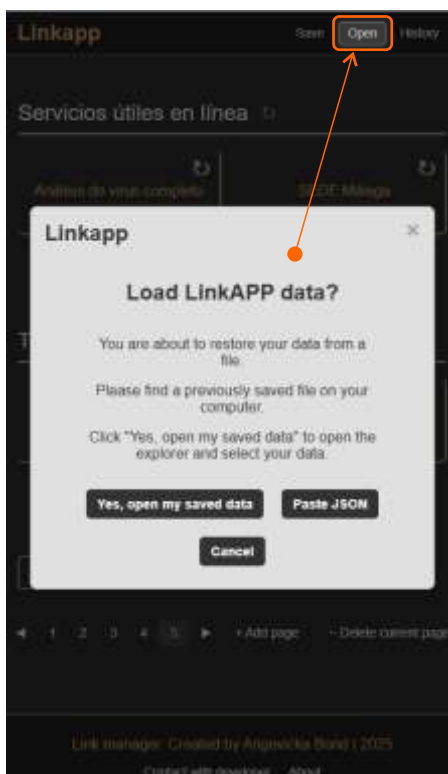

- **History.** If you accidentally delete something, click the "history" icon in the menu. You can restore deleted items from there.

If you have any bug reports or recommendations for improvements, you can contact the developer through the feedback form and suggest updates you'd like to see.

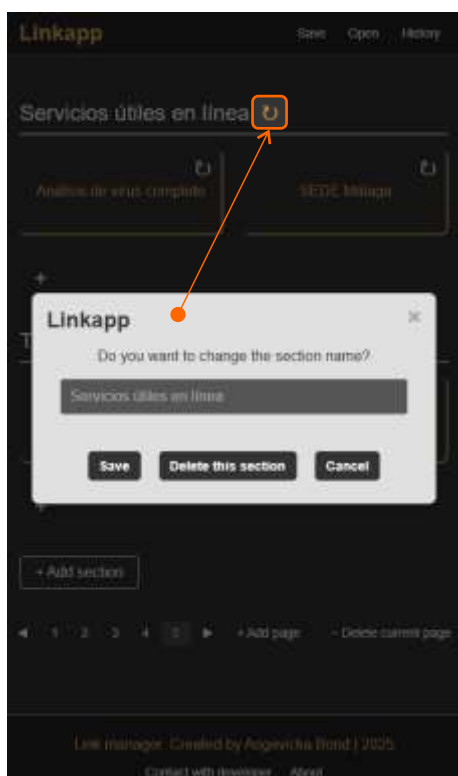

Save your changes (or rather, export them to a portable file so you can open them elsewhere using this app).

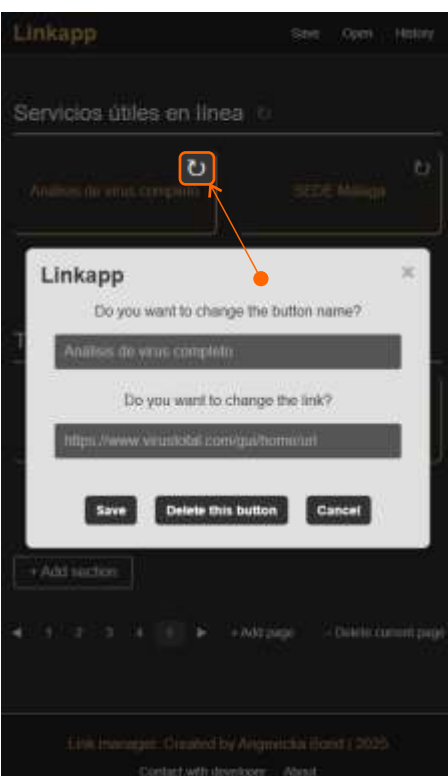

Open (or rather, import) the previously saved file containing the changes you want to transfer to another browser or device.

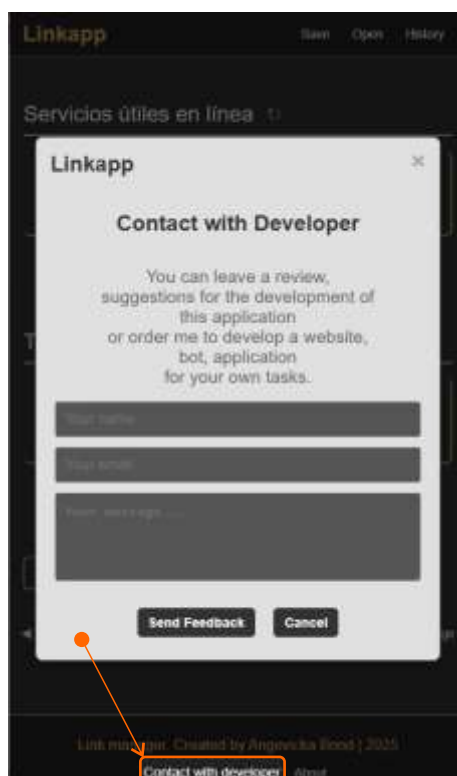

In **History** you can find accidentally deleted items or delete them permanently.

You can edit the section title.

You can edit the button title and its link.

You can send feedback to the developer.
